

Could You Have Lynch Syndrome*?

Lynch syndrome is a hereditary condition that makes people more susceptible to several cancers, including cancer of the colon, uterus, ovary, stomach, small intestine, bile duct, upper urinary tract, brain and skin.

If you know which family members have had certain cancers and the ages they were diagnosed, our genetic team can help with genetic testing, surveillance and management.

Record the number of relatives affected by each cancer type and their age at diagnosis, if possible. This will help with risk assessment in your discussion with the genetic counselors.

Visit kucancercenter.org/genetics to evaluate your risk.

Schedule an appointment today with a genetic counselor who specializes in cancer. Call 913-588-5568.
